

Material Consumption Monitor for Hopper Receiver

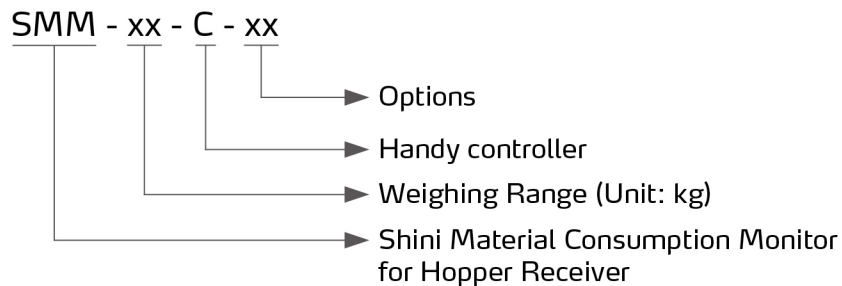

SMM-50

Refer carefully to this manual before operation.

SMM Series

Coding Principle

Handy controller panel

Features

- Real-time material consumption monitoring.
- Production batch control.
- Statistical Material throughput.
- Precision up to $\pm 1\%$
- The parts in contact with materials are made of stainless steel to ensure no material contamination.
- Standard communication function via RS485

Working Principle

After receiving the material loading signal from the auto-loader, the cylinder rotary rod starts working, holds up the discharging plate of the loader, and then starts to weigh. After material loading, the controller will read the stabilized value and then release the autoloader, thus completing a weighing cycle. The optional handy controller displays current weight, accumulative weight, set target output, and other functions.

Application

When used in plastic production, SMM can upload the weighing data to the main control of central conveying via the communication port. The main control monitors the material consumption of each unit in real-time and makes adjustments. To arrange production reasonably and reduce material waste.

Options

For high temperature model, add "H" at the end of the model code.
